Mean 30.758; Variance 161.149; scale 0.191 Statistics: Pred No is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 4, Fig 2; 128pp; English.

This polypeptide sequence comprises the heavy chain variable region
(VH), HBBI, Obtained by mutagenesis of the VH CDR3 of human
carcinoembryonic antigen (hCEA) specific antibody CEA6 (see
W1981). A claimed specific binding member (A) comprises an hCEA
specific antibody antigen binding Jomain that has a dissociation
constant for hCEA of less than 1 x 10 -8 M, is non-cross-reactive
with human liver cells, and preferentially binds to the A3-B3
cextracellular domain of hCEA and/or to cell-associated hCEA over
hCEA over soluble hCEA. Preferred (A) include pairings of VH and
VI. sequences from CEA1-7 (see W1988-95) obtained by
as well as CEA6 VH and VL variants (see W1988-95) obtained by
mtagenesis or chain shuffling. An example of a claimed pairing
is HBB11 VH with CEA6 VL. (A) is used to detect cells expressing
hCEA, in vivo or in vitro, especially tumour cells for diagnosing

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         attachment of staryl Lex side chairs (see R2442, FT). The additional N-linked glycosylation stres are introduced at locations which impair complement fixing and Fe receptor binding ability. They are preferably located in the CH2 region of the Iq molecule.

Antibodies bearing multiple stalyl-Lex determinants are useful for disrupting undestrable interartions between cells or proteins. Disrupting this interaction has therapeutic applications, for example, in minimising inflammation following tissue injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     zs gyjin gsgaedkkpyssyknachatissjaismyrjapgitemajiipiidiatan 83

```
This polypeptide sequence comprises the heavy chain variable region (VH), HBB6, obtained by mutagenesis of the VH CDR3 of human cardiomembryonic antigen (hCBA) specific antibody CBR6 (see M198B1). A claimed specific binding member (A) comprises an hCBA specific antibody antigen binding member (A) comprises an hCBA specific antibody antigen binding domain that has a dissociation constant for hCBA of less than 1 x 10 -8 M, is non-cross-reactive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCBA and/or to cell-associated hCBA over hCBA over soluble hCBA. Preferred (A) include pairings of VH and VL sequences from CBA1-7 (see W19876-85), or their CDR sequences, as well as CBA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. An example of a claimed pairing is HBB6 VH with CBA6 VL (A) is used to defect cells expressing C hCBA, in vivor or in vitro, especially tumour cells for diagnosing cancer, e.g. adenorationma of the colon, lung or breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   60 yaqkfggrltitadeststaymelsslrsedtavyycagrshtyel-yy--yymdvwggg 116

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 EVÖLLEGSGAEVKKFGSSVKVSCLVFGDIFSRYILUMLKLAPGUGPEWMGNIIPVYNIPN 50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include pairings of VH and VL sequences from CEA1-7 (see W19876-85), or their CDR sequences, as well as CEA6 VH and VL variants (see W19886-95) obtained by mutagenesis or chain shuffling. Examples of claimed pairings are 706D10 VH with 706D12 or CEA6 VL. (A) is used to detect cells expressing hCEA, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocarcinoma of the colon, lung or breast.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 601; DB 23; Length 123;

Claim 4, Fig la; 128pp; English.

This polypeptide sequence comprises the heavy chain variable region (VH) of human carcinoembryonic antigon (hCEA)-specific antibody CEA. VH (172126-32) and VL (172133-35) gene sequences were obtained for anti-hCEA antibodies CEA1-CEA7 (see W19876-85).

A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant of hCEA of less than 1 x 10 -8 M, is non-cross-reactive with human live hCEA and/or to cell-associated hCEA over hCEA over hCEA and/or to cell-associated hCEA over hCEA over hCEA and/or to cell-associated hCEA over hCEA over hCEA and vL sequences from CEA1-7, or their CDE sequences, as well as CEA6 WH and VL variants, including combinations of CEA6 VH with VL CE regions from CEA6, TOGOG, TOGOG,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'n
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      60 yaqkfqgrltitadeststaymelsslrsedtavyycagrshnyel-yy--yymdvwgqg 115

```
This polypeptide sequence comprises the heavy chain variable region (VH), HBAIL, obtained by mutagenesis of the VH CDR3 of human carcinoembryonic antigen (hEAB)-specific antibody CEAB (secondary) A claimed specific binding member (A) comprises an hCEA specific antibody antigen binding member (A) comprises an hCEA specific antibody antigen binding domain that has a dissociation constant for hCEA of less than 1 x 10 -8 M, is non-cross rearlive with human liver cells, and preferentially binds to the A3-B3 extracellular domain of hCEA and/or to cell-associated hCEA over hCEA over soluble hCEA. Preferred (A) include pairings of VH and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               expressing beed, in vivo or in vitro, especially tumour cells for diagnosing cancer, e.g. adenocateinoma of the colon, lung or breast

Disclosure: Page 78; 130pp; Bandish.

B-cell superantigen (sAg) is a fragment of SpA D domain that specifically binds the Fab pottion of variable region restricted antibodies. The sAg is used to enhance production of VH, sepecially VH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from Ig reactive with mod SpA, and as and DNA sequences (EP4882:15, 24481.55) of VH regions of SpA binders (SbA binders) and desired from combinatorial libraries were determined. IgM protein RAS is derived from the germline configuration of a VH gene

The sequences given in R31023-24 represent the heavy and light chains of Antibody D respectively. Antibody D is a monoclonal antibody which was derived from peripheral blood lymphocytes from a hepatitis A virus (HAV) sero positive patient. Antibody D is closely related in nature to munifody BSB3. Total RNA was isolated from antibody D expressing cells and polydonylated RNA was extracted. Those polyh RNA's were used to prepare a cDNA library which was screened for human Further heavy (H) chains and two positive clones were detected. Sequence 476 AA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       79 ysqnfqgrvtitadkststahmeltslrsedtavyycatdryrqanfdrarvgw-fdpwg 137

B-cell superantigen (849) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The Sap is used to enhance production of VH, sepecially VH3, restricted Abs. During attempts to identify sAgs, as sequences (R54784-801) of H chains from Ig reactive with mod-SpA, and as and DNA sequences (R54802-16, 02481-56) of VH regions of SpA binders bobtained from combinatorial libraries were determined. IgM protein BOR is derived from the germline configuration of a VH gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 vqlv-qsgaevkkpgssvkvtckasgdtfsssaiswvrqapgeglewmggiipifgtpny 59

L. and H-chain DNA was amplified by PCR from Graves' orbital tissue and clones encoding autoimmune-associated immunoglobulin fragments were obtained. 13/15 clones of H chain [1931] genes showed homology to the closest germline genes, DP10 (089327) and hv1263 (089328). The DNA (089329) and corresp. amino acid (R72070) sequences of the VH region of a representative clone, Sequence 98 AA;

Treating glomerulonephritis with antibody against complement C5 component to inhibit complement induced cell lysis Example 11, Fuge 119-122, 181pp. English.

A humanised CDK-grafted and framework sequence-altered Fd, 551.1 VH + IGHPL (P77510), includes CDRs derived from mouse anti-C5 monoclonal antibody 561.1. It can be co-expressed with a humanised light chain (P77512) in human 22* ERNA cells using encoding DNAs subcloned into vector APEX-*P (T08475). Such humanised recombinant antibodies retain the ability of MAP 561.1 to block human complement C5a generation and thus to reduce glomerular inflammation and kidney dysfunction associated with glomerulonephritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Programment the many chains of the human anti-herpes monoclonal antihody clone EachsVW. This antibody is capable of neutralising both herpes simplex virus (HSV) types I and II by binding an epitope present on diveoprotein D. The antibody may be used for detecting HSV in vivo on in vitro; for passive immunotherapy (pref. prophylactically) of HSV infection (eq. genital, oral or coular herpes), partic, as its Fab fragment and as a competitive reagent for detection neutralising anti-HSV antibodies in a sample. Anti-idiotypic antibodies raised against the mAb can be used for active immunotherapy of HSV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        79 yaqkfqgrytmtadtststaymelsslrsedtavyycaryffgss-pu---wyfdvwqqq 134

From a cancer patient

Claim 19: Page 75-76: 82pp; English.

A process for isolating and synthesising human monoclonal anti-tumour
antibodies has been produced. The process involves: (a) constructing at
least one fusion phage library from the peripheral blood lymphocytes

(PBLS) of a cancer patient; (b) screening for anti-tumour antibodies in
the phage library in a binding assay with cultured tumour cells of the
same type as the patient's tumour; (c) removing extraneous antibodies in
the phage library in a binding assay with cultured tumour cells of the
same type as the patient's tumour; (c) removing extraneous antibodies by
absorption against normal human cells; (d) cloning the phage selected in
step (b) and (c); (e) assaying the specificity of the cloned phage by
coubating the phage with at least two types of cultured normal cells;
and (f) further testing the specificity of cloned phage that do not bind
to cultured tumour cells derived from more than one other tumour that is
not the patient's tumour. The present sequence represents a human heavy
chain antibody, from a VH antibody fusion phage library, produced by
a method as described above. The antibodies produced can be used for
diagnostic and therapeutic applications and for isolating tumour

antigens for studying tumouringeness or for use as anti-cancer vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            7; Gaps
                                                                                                                       28-OCT-1997 (first entry)
Anti-melanoma antibody 2-71 from VH antibody fusion phage library.
Human: monoclonal antitumour antibody: peripheral blood lymphocyte;
cancer: tumourigenesis; anticancer vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The human antibodies have low immunogenicity in humans compared to murine monoclonal antibodies (MAbs). Since the antibodies are isola from fusion phage libraries, their affinity and specificity for a tumour cell line can be improved by genetic manipulations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Prodn. of human monoclonal anti-tumour antibodies - by screening a fusion phage library produced using peripheral blood lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    59.9%; Score 558; DB 23; Length 119; larity 71.7%; Pred.
